

# *Mosquito Forecast*

For the Week of May 11-17, 2019

## NUISANCE LEVEL

## DISEASE THREAT

Reports of biting mosquitoes have decreased from the previous couple of weeks, however, the numbers of our area's primary West Nile virus vector have climbed in some traps located in the midtown/downtown regions of Savannah. These mosquitoes prefer more stagnant water than other species of mosquitoes, and their larvae are often found in the more hidden containers, depressions, and other places that have accumulated lots of debris. Please remember to empty any such containers of water, and contact Mosquito Control if you are currently experiencing any mosquito problems in your area.
